Pneumatic cylinder

Valves of type 5470 consist of a type 6104 pilot rocker solenoid valve and a pneumatic valve.

An armature with a tilting bearing, similar o a rocker, tilts within the body of the pilot valve, and switches the valve. The minimal tilting movement of the rocker is non-wearing, and basic lubrication is unnecessary.

The type $5470~\mbox{R}$ is available as a $3/2~\mbox{and}~4/2\mbox{-way}$ valve. The valves can be mounted together individually using the module flange. In various applications, they can be used advantageously as valve blocks. Different variants are available for service ports 2 and 4.

Power consumption

corresponds to the effective coil power in the ordering chart.
